

I'm really excited about the Full-Stack Software Engineer role. I've always liked building things, from small coding projects to bigger apps during school and internships. Burq's mission to make delivery simple really stands out to me, because it feels like solving a real-world problem that everyone can understand.

I've worked with React, Node, and SQL to build full-stack apps, like an AI-powered resume tool and an earthquake aftershock prediction pipeline. I enjoy owning both the frontend experience and the backend logic, making sure everything works smoothly end-to-end. What I don't know yet, I'm always ready to learn- I pick things up fast and enjoy figuring things out by trial and error.
