

Hi team,

I love building things from scratch, and that's what excites me about your AI/ML Engineer role. My journey started when I left home to join a scrappy EdTech startup in a different city and has since taken me to Apple, Vanderbilt IT, and Tufts, building everything from real-time backend services to scalable retrieval systems.

What drives me is figuring out better ways to solve problems in an efficient way. I really like going through research papers and scouring engineering blogs like Uber and DoorDash, always looking for practical ideas and cutting-edge solutions to improve my work. My solo projects include building RAG pipelines from the ground up by using FAISS, LangChain, and OpenAI models, plus deploying and securing backend APIs (FastAPI/AWS), so I'm comfortable owning a product end-to-end.

Startups energize me because I like turning ideas into demos fast, collaborating across teams, and learning by doing. I'm really interested in working with your team because you're at that rare intersection of technical ambition and product vision, and you clearly value curiosity and initiative. There's something uniquely motivating about being on the ground floor, figuring things out together.

I want to join a place where my drive for research, practical building, and curiosity can help shape something unique from day one. Let's make something great together.

Best,
Anmol Baruwal
